

1        **ABSTRACT**

2        An optical-interference type display panel and a method for making the  
3        same are disclosed, wherein the display panel has a substrate on which multiple  
4        first conductive optical film stacks, supporting layers and multiple second  
5        conductive optical film stacks are formed. The substrate further has a plurality of  
6        connecting pads consisting of a transparent conductive film of the first  
7        conductive optical film stacks. Since the transparent conductive film is made of  
8        indium tin oxide, these connecting pads have the excellent anti-oxidation ability  
9        at their surface.
